The Problem & Our Solution

Splitting group expenses is awkward and messy. Settle turns chat into fair, verifiable on-chain settlements in one tap.

- Group expenses (travel, dinners, rent) are tracked across scattered apps and screenshots
- Asking friends for money is socially uncomfortable and often delayed or forgotten
- IOUs lack a trustworthy, shared record everyone can verify
- Settle: AI reads the conversation, computes fair splits, and issues Solana Pay links instantly
- Turns natural language into verifiable, one-click stablecoin payment requests

How It Works

From chat log to on-chain settlement in four simple steps, powered by AI parsing and Solana Pay.

- User pastes chat log or uploads a receipt photo into Settle
- AI (OpenAI API) extracts expenses, participants, and custom split rules
- App calculates fair splits and generates a Solana Pay QR/link per debtor
- Debtor scans and pays instantly in USDC; settlement is recorded on-chain
- Shared group dashboard shows on-chain ledger of who paid whom, with reminder nudges

Built with

Solana, Solana Pay, Rust/Anchor,
OpenAI API, Next.js, Phantom Wallet
Adapter, USDC

Why Now & What's Next

Solana Pay and stablecoins make instant settlement practical, while LLMs finally make messy chat parsing reliable.

- Solana Pay + USDC enable instant, low-fee settlement at consumer scale
- LLMs can now reliably parse unstructured group chats into structured expense data
- Next: multi-currency and FX-aware splitting for international groups
- Next: native Telegram/Discord bot integration for in-chat workflows
- Next: partnerships with stablecoin issuers for cross-border travel payments
